PREFACE

Globe Wireless contracted with Ten Tec a some years ago to produce a modified version of the RX-320 for shipboard use as a secondary receiver in their shipboard communications system, and Ten-Tec designated it the RX-321. GW was able to do this as GW is one of Ten-Tec's single largest customers. GW uses the RX-330(A&B) and the RX-331 receivers at their shore side stations of their global HF digital maritime communications network. They have well over 300 of them in use worldwide with great success.

As delivered to GW, there is a hardware remote control, with volume and on/off controls, two GMDSS modules, as well as a speaker and LED indicators all in a machined box. Also included is a spool of coax cable, and a huge weatherized metal enclosure.

The RX321 was based on the RX320 and was built to their specifications for Globe Wireless for a shipboard GMDSS project..

"The Global Maritime Distress and Safety System (GMDSS) is an international system which uses improved terrestrial and satellite technology and ship-board radio systems. It ensures rapid alerting of shore-based rescue and communications authorities in the event of an emergency. In addition, the system alerts vessels in the immediate vicinity and provides improved means of locating survivors." -Globe Wireless in letter to Ten-Tec

Globe Wireless abandoned the project and sold off the unused units – best guess as to quantity is around 100 units.

Ten-Tec has made it clear that they do not provide support for the RX-321. It seems no manual was ever prepared for the RX-321 and Globe Wireless just relied on the unit's niche application and in-house engineering to avoid having to ever need to pass an understanding of how the receiver works or is used. Jim Handcock started collecting information on the RX-321 and put up a fine web page at

<http://blacktailbooks.com/rx321.html>

A lot of people provided tidbits and pieces of the RX-321 for his web site. We saw a need for a User Guide for the RX-321. This should be something a RX-321 owner could print out and have to refer to from time to time about the receiver. We mainly used Jim's web site and a few other pieces to construct **Radio Receiver RX-321 The Manual That Never Was**.

A real tip of the hat to Jim and all his contributors. Jim is very much into books with his own bookstore out in Kalispell Montana. What a great way work and place to live.

Frank Gentges K0BRA

CHAPTER 1

GENERAL INFORMATION

The RX-321 DSP HF receiver is a computer controlled communications receiver which contains Radio Frequency (RF) and Digital Signal Processing (DSP) circuitry to receive radio signals and convert them to audio. Unlike conventional receivers, the RX-321 has no front panel controls and instead relies on the computer for all user functions of control and display.

The RX-321 is a triple conversion receiver with intermediate frequencies of 45 MHz, 455 kHz and 12 kHz-the final conversion being for the DSP circuitry. The receiver covers the range of 100 kHz to 30 MHz and provides for AM, SSB and CW reception. The RF circuitry provides for tuning in 1 Hz steps with 10 Hz accuracy and the DSP circuitry provides 33 selectable bandwidths. The RF circuitry also provides a set of $\frac{1}{2}$ octave passband filters and high dynamic range mixers for high performance in the presence of other local signals. The receiver runs off of a single DC source of 12 to 28 volts DC. Pictures of the receiver front is shown in Figure 1 and the rear in Figure 2.

FIGURE 1: RX-321 Front View

FIGURE 2: RX-321 Rear View

CHAPTER 2

OPERATION

The RX-321 control software defines the operation of the receiver. A large number of software programs have been written for the RX-320 and work for the RX-320. Each program seeks to provide a set of displays and controls to meet the operational needs of the user. As a diverse set of users seek different features, diverse software provides different functions and features. Each user should try the different programs and select those programs best suited to the use and needs of that user.

Most RX-320/RX-321 control programs present the receiver with a front panel looking much like a traditional receiver and controls. The user should consult the documentation for each program to determine the details of operation.

The RX-321 utilizes the same serial control interface as the RX-320. Ten Tec control software (and others, including the Palm OS version) works exactly the same. Receiver parameters available (as observed) are the same. The front end bandpass filters are selected by the RX-321 firmware and the process is transparent to the receiver tuning process.

For details on writing software for RX-320/RX-321 tuning and control, refer to the RX-320 PC RADIO Programmer's Reference Guide.

Physical:

8 inches wide x 8 inches deep x 3 inches high.
Bottom mounting ears with holes for bulkhead mounting are provided.

Receiver Frequency Coverage:

100 kHz to 30 MHz

Receiver Tuning Step:

1 Hz tuning steps

Receiver Modes:

Amplitude modulation (AM)
Lower sideband (LSB)
Upper sideband (USB)
Continuous-wave (CW)

Receiver Performance:

AM sensitivity: 0.64 uV, wide filter
(80% modulation, 1 kHz tone, 12 dB S+N/N).

SSB sensitivity is 0.3 uV, 2.5 kHz filter.

Receiver Bandwidths:

Filter #	Bandwidth
0	6000
1	5700
2	5400
3	5100
4	4800
5	4500
6	4200
7	3900
8	3600
9	3300
10	3000
11	2850

Filter #	Bandwidth
12	2700
13	2550
14	2400
15	2250
16	2100
17	1950
18	1800
19	1650
20	1500
21	1350
22	1200
23	1050

Filter #	Bandwidth
24	900
25	750
26	675
27	600
28	525
29	450
30	375
31	330
32	300
33	8000

Receiver Input:

Power:

DC power of 12-28 VDC on a barrier terminal strip.
An On-Off switch is provided on the rear panel
A power indicator is provided on the rear panel

Antenna:

SO-239 connector

Receiver Output:

Audio Output:

Speaker, barrier terminal strip

DB9-M connector includes remote features with the following pinouts:

Pin 1 Line audio (balanced)

Pin 6 Line audio (center tap)

Pin 2 Line audio (balanced)

Pin 5 Mute (?) (ground to mute?)

Pin 9 Ground

(The line transformer is a standard feature of remote site receivers for 600R balanced lines.)

Receiver Intermodulation Performance:

3rd order: +15 dBm intercept point

2nd order: +60 dBm intercept point

The RX-321 has a set of front end bandpass filters and controls these filters transparently and no special tuning commands are required to to control them.

Receiver Control:

Serial Interface: DB9-F connector
USB Adapters: USB Port to RX-321 Operation:

Some computers are not supplied with a serial port but do have a USB port. Some users with these computers use a USB to Serial converter. Some converters known to work well in this application are:

- Belkin Usb To Serial Portable Adaptor, Part # F5U409v1, the Belkin F5U103 and F5U109 usually work well also.
- Tripplite Usb/Serial Converter Cable
- Keyspan USA-19QW or USA-19W
- Cables To Go USB To Db9 Serial Adapter USBa/db9m Rs-232
- The RadioShack 9 pin Serial to USB adapter cat#26-183 works well through both USB 2.0 ports and through powered USB hubs.
- [IOgear GUC232A](#) works great with the RX-320D. It also has drivers for Vista (not with the hardware; you have to download new drivers).

CALLSIGN SOFTWARE provides some insights on problems with these.

"USERS WITH USB to SERIAL Adapters: Some of our users have had many problems with these devices because most cannot keep up with the duty cycle rates of a NULL Modem or the supplied software driver does not properly comply with the Microsoft Windows(c) Driver model. NULL Modem compliance means that they MUST be capable of sustaining a continuous data stream much like that encountered when downloading files. They must also support modem controls for data flow control which we use on all the radio products that support this.

Failure of the USB/Serial Adapter to comply with this will result in improper operation of the software. These capabilities must be stated on the product. We recommend the RadioShack 9 pin Serial to USB adapter cat#26-183. It is less than \$50.00, comes with an XP and 2000 driver, and is widely available. We have been using this adapter (four of them) and have had no problems with them on Window's 2000, XP PRO, and XP Home. We have been using them with a USB 2.0 port and a four port USB 2.0 hub. We have also tested the software with PCMCIA (Serial Gear RS-232C) to serial adapters. We have thoroughly tested the software with the previously mentioned adapter(s) and found no problem with them for the past three(3) years. These adapters have software drivers that are well behaved in Windows and do not interfere with the operation of Window's, or other drivers, as some VERY POORLY written drivers do from some of the other vendors."

Control Programs

Ten-Tec had the wisdom to publish the control codes for the RX320 as RX-320 PC RADIO Programmer's Reference Guide. The result was a number of different programs to control and display the RX-320. These programs work transparently with the RX-321 and the Past & present RX320/RX321 Control programs, mods are shown here. Some of these programs are in the Files section of the Yahoo RX320 group. See the Monitoring Times article at:

CHAPTER 3

FUNCTIONAL DESCRIPTION

RX-320/RX-321 Design Details and Differences:

- The basic heterodyne scheme is shown Figure 4.

FIGURE 4: RX-320/RX-321 Mixing Block Diagram

- Receiver Tuning Speed:**
When changing synthesizer frequency, there is significant "chuffing" (short noise bursts as the synthesizer steps in frequency) at times, enough to make VFO type operation (many steps over a short time interval) somewhat annoying to the listener.

The RX-321 is intended for use in a channelized system without the need for frequent retuning. The "chuffing" is probably a result of lengthened PLL loop filter time constants to improve the phase noise characteristics of the synthesizer, and the chuffing noise is generated as the PLL unlocks temporarily upon a frequency change.

There is a compromise in PLL design between lock time and VCO phase noise, and apparently Ten Tec chose to favor decreased phase noise over lock time in their design, which is acceptable in this application. This kept costs down by eliminating the need for a higher-performance, i.e. More complex and expensive synthesizer.

- TCXO's for 2nd and 3rd LO oscillators are added. The RX321 is dead on within 10Hz cold or

warm.

Reference Oscillators: The two oscillator cans on the RF board are not "ovenized" but are TCXOs (Temperature Compensated Crystal Oscillators) built most likely by Fordahl and are spec'd at +/- 10 Hz over 0 to 40 degrees C. These TCXOs bear the part number of "DFA 14 KHV". From Fordahl's "Generic Ordering Codes" sheet this part number translates as:

DFA = TCXO

14= DIL 14 (dual in-line 14 pin)

K= -30 to +60 degrees C

H= HCMOS logic level output

V=external control voltage.

That final V suggests the little pots (R104 and R106) next to the oscillators create a trimming voltage to put each on its frequency.

- 7 front end filters added. switched by pin diodes. Firmware provides control of this front end filtering.
- 1st mixer has improved double-balanced quad fet mixer for higher IP values.
- AGC injection on 3 points with extra gain controlled dual-gate FET right after 45 MHz IF filter.
- Added Pin diode AGC following preselection and 45Mhz filter.
- The active antenna circuitry inside the RX320 is gone with the RX321. That circuit could have been a source of intermodulation products.
- The antenna connector is an SO-239 on the RX321 instead of the RCA plug on the RX320.
- The DC power is shown as 12-28VDC on the RX321 instead of the unspecified power on the RX320.
- Power supply: separate board for voltages. Added a step-up voltage regulator for higher voltages for front end. I measured 18V to front end. Low ripple and noise.
- DC power and the speaker connect via a terminal strip on the RX321 while the RX320 uses phone plugs and DC coaxial connectors.
- RS232 device is a ADM232AARN instead of max232 type.
- Remote audio line out on the RX321 is a balanced, center tapped transformer. Line level audio output through an isolation transformer, balanced audio out.

- The RX321 has a mute connection.
- The RX321 comes with a nice little 120 VAC to 12 VDC switching power supply.
- The RX321 has a power LED and a more rugged power switch.
- The RX321 runs on RX320 software and it seems to work just fine with all functions doing what they should. The DSP board is slightly different with a different part number and different EPROM identifier.
- The IF is not brought out like on the RX320D for digital radio. The cable can be spliced and an IF output added.
- It works down to 100 kHz.

CHAPTER 4

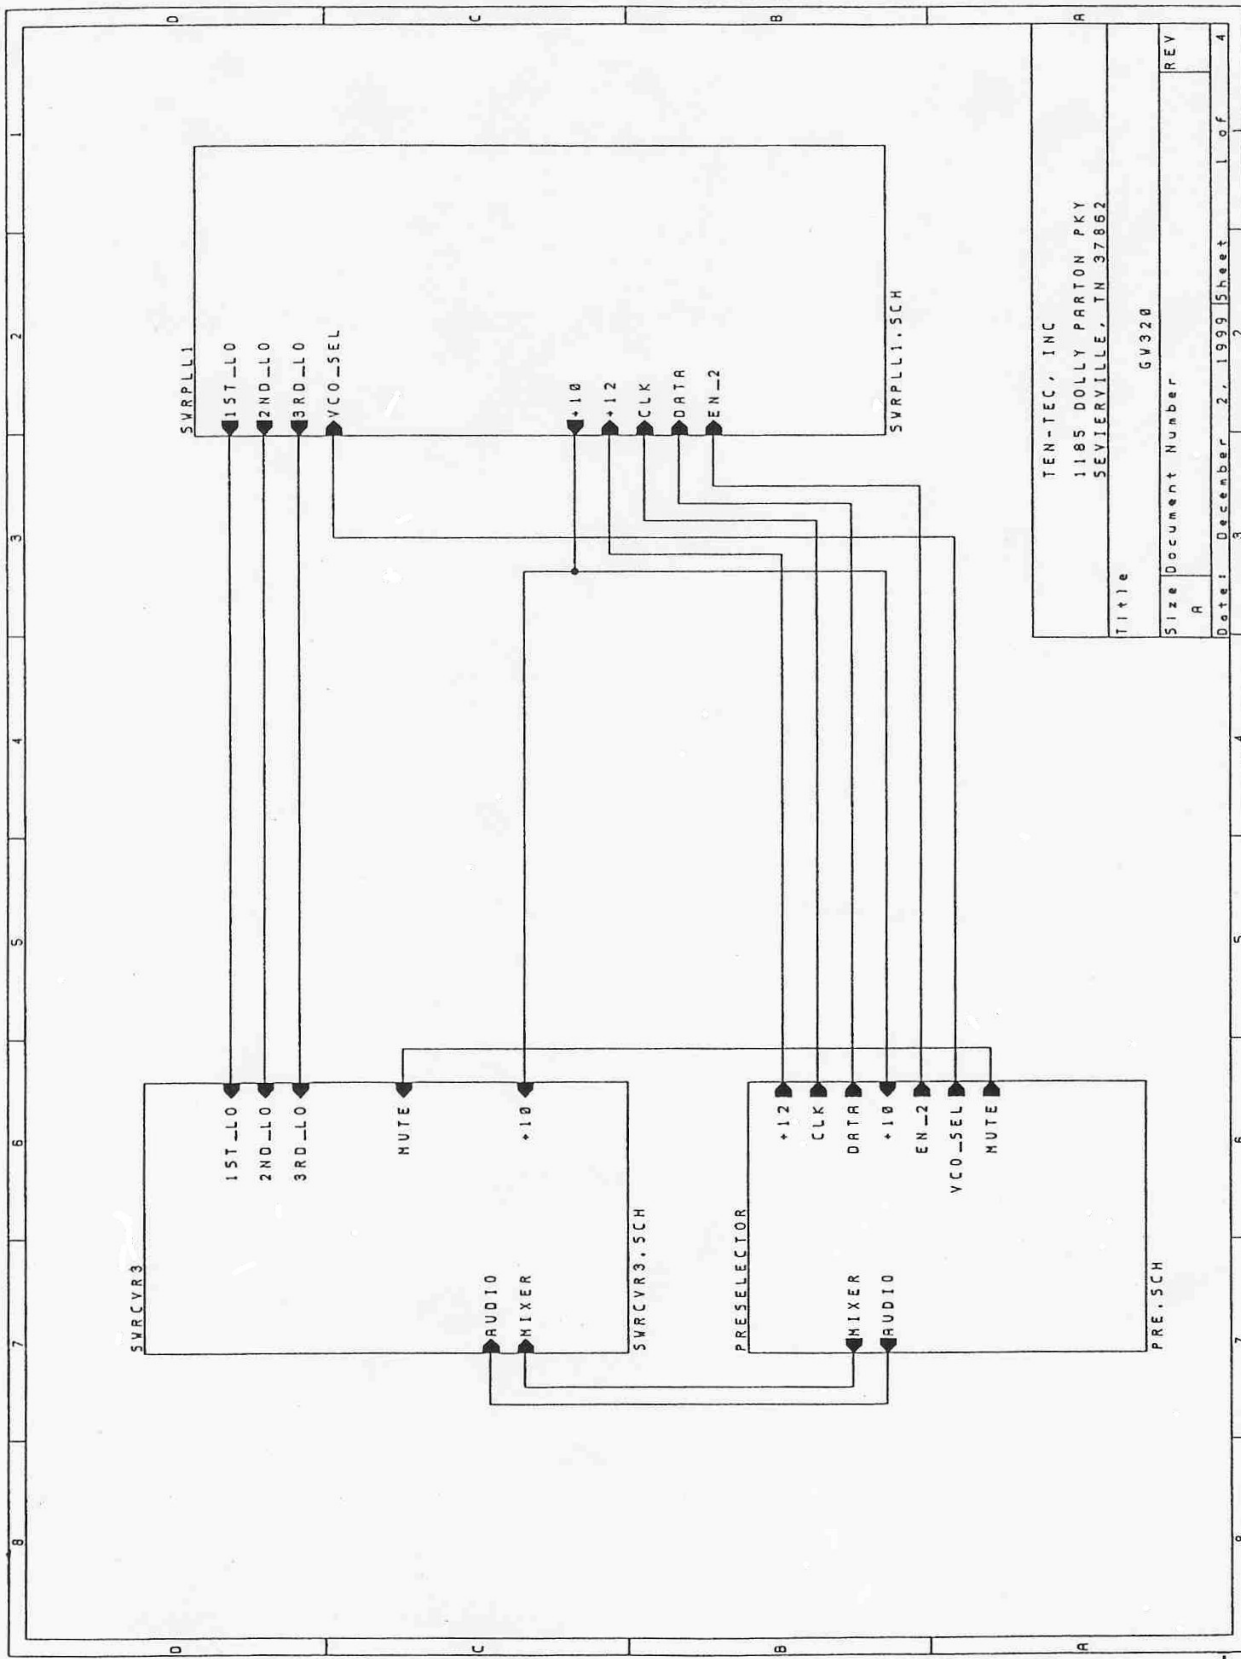

CIRCUIT DIAGRAMS

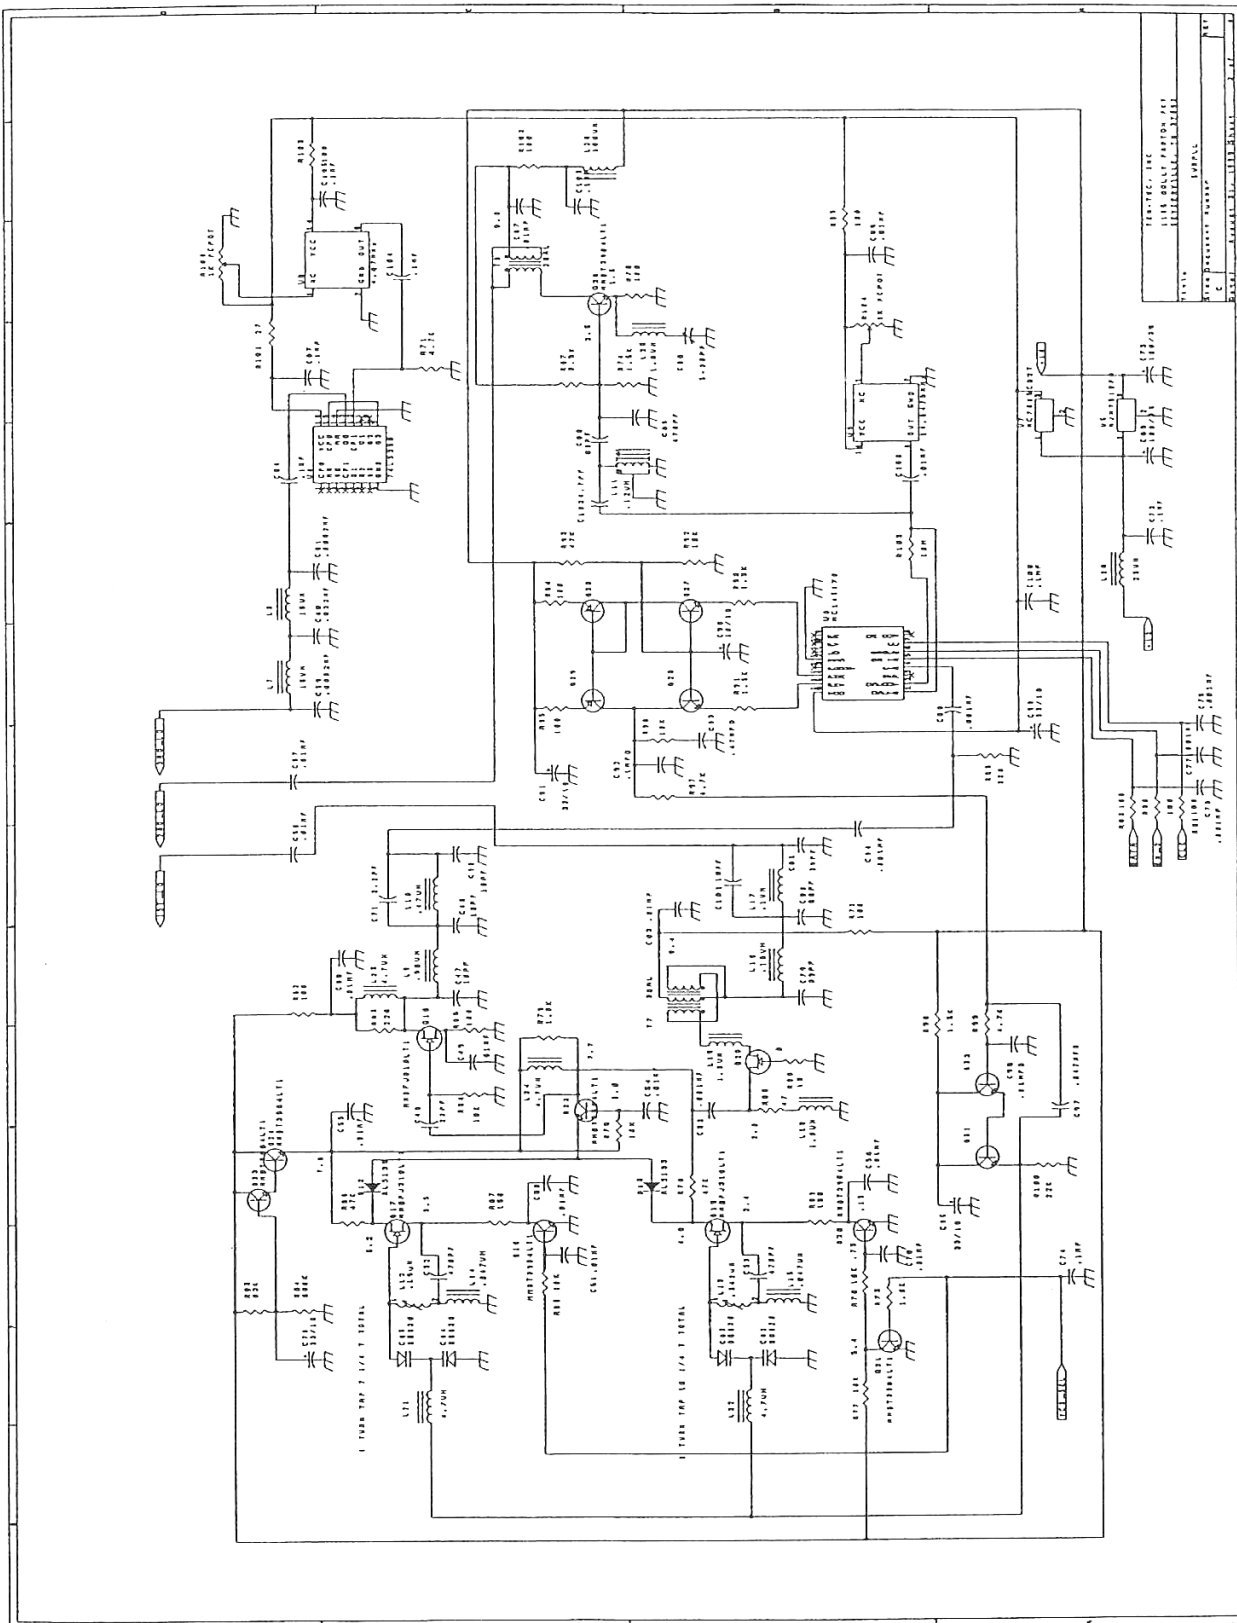

Somewhere along the line, an anonymous person provided a set of circuit diagrams for the RX-321. We are all appreciative for these.

Prior to this, we took a picture of the RF board and marked the various circuit areas and what function was in each place. That picture is included. It should prove helpful for finding different parts of the circuitry for modification or repair.

APPENDIX 1

eBAY AUCTION TEXT

Ten-Tec RX-321 HF Receiver. DRM ready This receiver is the RX-321 made by Ten-Tec, it is a custom version of the RX-320 PC Radio. It has also been modified professionally, to add 12 kHz DRM output at the remote jack. As mentioned it has been modified for DRM. The DRM pin has been professionally added to the 9-pin jack on the rear panel, see picture.

I am including the HF radio receiver, RX-321 and the small switching power supply that powers it. I have purchased several over the last few months and had them all modified. I am running 3 now, but just have a few spares. They really work great, I'm sure you'll be pleased with your purchase and the specifications are better than the RX-320's, as is the performance.

I am not providing any documentation with this radio. However, more information can be found at the ten-tec website:

<http://radio.tentec.com/Amateur/Receivers/TT320>

along with free software. There is also a users group at:

<http://groups.yahoo.com/group/RX320>

NOTE: This radio is similar to the RX-320D, not the older RX-320. It does have an IF output at the DB-9 connector (clearly marked, see picture) allowing for quick DRM functionality. You will have to get the proper software for DRM. The radio control software and programming manual for the RX-320 can be found at:

<http://radio.tentec.com/Amateur/Receivers/TT320/Downloads>

There are lots of shareware and free programs as well as some very nice professional programs available that will operate this radio. RX-320 vs. RX321: The RX-321 has the following physical differences from the RX320:

1. There is NO independent Line Out jack jack, however audio out is accessible through the "Remote" DB9 connector.
2. There is NO whip antenna provision. (Almost useless anyhow, a real antenna should always be used.)
3. An antenna is required via the UHF connector, not a cheap RCA type connector, as on the Rx-320.

The RX-321 has the following Performance Improvements:

1. Improved oscillator w/ +/-10 Hz frequency stability. (0 to 40 C).
2. 2nd order intercept +60 dBm. 3. 3rd order intercept +15 dBm. If you want a more complete list of RX-320 Specifications (not true RX-321 Spec?s) visit:

Radio Receiver, RX-321 User Guide December, 2007

<http://radio.tentec.com/Amateur/Receivers/TT320>

"Remote" Connector Pinout: Pin 1 Line audio 600 Ohm Pin 2 Line audio 600 Ohm Pin 3 12Khz IF Pin 4 Ground
Pin 6 Line audio (center tap) Pin 9 Ground.

Please note that Ten-Tec does not provide customer support for the RX-321, since it was a custom radio made for Global Wireless. This is a surplus radio and they are in very good condition.

Cash, Certified Bank Check or U.S. Postal Money Order only. U.S. Orders only. A fixed shipping/Insurance charge will be \$20.00 via U.S. Post Office Insurance value will be for the full winning amount. It will be carefully wrapped and shipped with 2 days of receipt of payment. Thanks for looking, you?ll really enjoy this radio and Good luck.

Great value! Time owned: more than 12 months

I use this receiver primarily for MW DXing, and find that the RX-321 compares very favorably to my Drake R8B, and my Icom 746Pro for this purpose.

Connections are simple. 50 Ohm Antenna, Ground, 12 Volt DC, serial cable for the PC, and a shielded audio cable that runs to your soundcard.

Lots of software, (freeware and otherwise) available...virtually anything that works with the RX-320 works fine with the RX-321.

Best features? Lots of bandwidth options, Passband tuning...etc. I also often feed the 8khz wide audio signal to the DReaM software, which requires a 14khz IF signal, but works fine using the 8khz wide audio signal as an IF...this then allows you to customize any filter shape and see the spectrum. Amazing combination for MW DXing, at a very affordable price.

If you're serious about MW DXing and on a budget, you'll find it hard to beat the RX-321. Also use it to monitor secondary frequencies during Hurricane Season, and it works great as a SW-HF receiver too.

SWL377 <<http://www.eham.net/user/profile/SWL377>> Rating: 5/5 Aug 2, 2005 10:32 Send this review to a friend
<<http://www.eham.net/reviews/mailto/41543>>

Great rcvr but a Ten Tec orphan Time owned: 0 to 3 months
I own both a Ten Tec 320 and, finally succumbing to the chat group pressure, a 321. The 321 has considerably better front end and freq stability specs than the 320, but I have yet to see any real world difference in performance. Maybe in a strong signal environment the 321 would outshine the 320, but at my location they seem to be about the same performance wise. Remember if you buy a 321 you are on your own, Ten Tec will NOT service them or even answer any questions about them. The otherwise nice folks at Ten Tec snarl and snap if you even ask about support for non standard radios like the SP 325 they made for the US Navy (yes, I have one of these too).

Globe Wireless apparently had the 321 custom engineered by Ten Tec as the heart of a GMDSS rcvr system that as far as I can tell never made it to market. My guess is that there were less than 100 of these made.

Do I enjoy using my 321? Well, actually not so much. I just don't like the computer user interface. I like knobs and switches. There are some aftermarket knob and switch kits for these rcvrs, but they still don't give you the feel of a full panel of knobs like you'd find on an old Hammarlund or Hallicrafters.

Should you buy a 320 or a 321? If you are worried about service, get a 320 definitely. If you must have the better specs in a 320-like radio and are willing to risk breakdowns without any service availability, then get a 321. Both are fine rcvrs and truly AMAZING values when you examine price vs performance. Nothing else comes close, not even the Sony 2010 which for years was the value leader.

Either the 320 or 321 will outperform non DSP rcvrs costing perhaps ten times their price. Would a 321 stand up against the holy Collins R 390 A? Don't know. Synthesizer noise in the 321 could be an issue, but the DSP magic might gain back the advantage lost by the synth. Would be an interesting SW rcvr shootout indeed.

Excellent commercial upgrade to the TenTec RX-320 Time owned: 6 to 12
months

Globe Wireless had the specifications of the RX-320, with which I
already owned and am quite pleased, upgraded for maritime use.

-Frequency stability is rock steady. Accuracy is ALWAYS within a hertz
or two of WWV/CHU Standards. This is due to the temperature compensated
crystal oscillator (TCXO). (Hint, you can use this receiver to align
your other equipment in the shack)

-Sensitivity has been improved from the already great RX-320 model from
which it was modified. Actually the sensitivity is most likely the same
as the RX-320, but because of better front end design, the receiver
doesn't suffer from desensing due to nearby strong signals.

-Automatic Pre-Selectors prevent out of band blow-through of very strong
locals.

If you see this radio come up on eBay for the same or less price of a
new RX-320, buy it!

KC0PPA <<http://www.eham.net/user/profile/KC0PPA>> Rating: 5/5 May 1,
2005 23:18 Send this review to a friend

<<http://www.eham.net/reviews/mailto/39319>>

The software makes it. Time owned: 0 to 3 months

I found out that the RX-321 is as good or better than my Drake R-8.

What makes the computer controlled RX-321 great is the control software.

I have been trying many of the programs out there. I have not decided on
the best one yet. Each has it pluses and minuses.

I like the ability to download the station lists from the internet. From
this you can quite easily id or find a station. The way you can run down
the list one by one is a nice way to see what's on. The band scan
function lets you see at a glance what is on that band. It is also easy
to make your own list. With the ability to make more than one list it is
like having unlimited memories. Just a click of a button and it is
added. Many regular radios have this function. But with the list on on
the software it is much easier to pull up.

Like I told a fellow radio friend, "It is better than sliced bread"

It got my interest back into the shortwave hobby.

TUBESAREKING <<http://www.eham.net/user/profile/TUBESAREKING>> Rating:
5/5 Apr 21, 2005 07:14 Send this review to a friend
<<http://www.eham.net/reviews/mailto/39023>>
Superb Time owned: 0 to 3 months
Just bought this for \$220 US on eBay. The seller was 1st class all the way. The product is spectacular.

I'm using it with a 1996 era Toshiba laptop [Pentium 1]running Windows 98 and that ancient combo works just fine with this hi-tech black box receiver.

Sensitivity is the equal or better to my Drake R8. Selectivity is much better on the Ten-Tec than the Drake. The RX-321 can handle my two local MW 10KWers even with my 70 foot V antenna, 6 foot ground rod, and SWL1G balun. The poor Drake gets images of these stations everywhere unless I really pad the antenna down.

Audio quality is very good at 8 KHz BW. For DX, there is a wide choice of narrower BWs to choose from.

I am primarily a MW DXer, and was pleased to see that it pulled in 530 KHz from the Turks and Caicos solidly and free of noise. The Drake pulled in the same station but with moderate background noise.

A local beacon prevents reception of Ireland on 252 KHz on the Drake, no matter how much you use BW options, USB/LSB, PBT etc. Simply impossible. With the Ten-Tec RX-321, all you do is choose the 3.1 KHz BW and presto, Ireland 252 coming in clear as a bell.

France 1377 - audible but noisy on the Drake. Noise free on the Ten-Tec. the Ten-Tec is great for TA MW DX.

The Ten-Tec RX-321 is simply the best LW, MW, SW receiver I have ever experienced. Period.

It looks like the last of these may be gone. Perhaps Ten-Tec will introduce this for regular sale. It is a winner. Since it was a custom project, they may have to revise it somewhat for regular sale, but it is a winner. Just add the Ten-Tec logo to the front, and a 12 KHz IF output jack to the back, call it the RX-321D and watch the orders roll in.

Clearly superior to the Drake R8. That is not to knock the Drake, which in my opinion is a very good receiver. It is just that Ten-Tec has made a PC based black box which runs circles around virtually anything else. The Drake R8 family is very high end consumer grade. The Ten-Tec RX-321 is commercial/military grade.

The Ten-Tec has a real case, unlike the thin material on the Drake.

The only thing it lacks is the "feel" of a conventional receiver.

Kudos Ten-Tec!

Great Receiver Time owned: months

Having had an RX-320 for about 6 years, I didn't hesitate to buy an RX-321 for \$200. I wasn't worried about factory service as the RX-321 has been running without shutting sdown since new without a failure. The RX-321 has more stability and a much stronger front end compared to the RX-320. An outstanding receiver.

Excellent Receiver Time owned: 0 to 3 months

This is a custom version of the Ten-Tec RX-320 made for Global Wireless. It is functionally very similar to the RX-320 and uses the same control interface software. The receiver is very sensitive and very good in a high RF level environment. I modified mine to bring the 12 Khz IF out for my DRM demodulator. The DSP works great and the frequency is dead on. I picked this receiver up on e-Bay for \$200 and it is a great buy. There is no tech support for these from either Ten-Tec or Globe Wireless but it is well made and should last for a long time.
